Attestify: Platform for Decentralized Attestation

INTRODUCTION

Attestify lets you create secure attestations on the Ethereum blockchain. It uses EAS for publishing attestations, Lit Protocol for encryption, and Anon Aadhaar for privacy-preserving identity verification.

OBJECTIVE

- Decentralized Attestations - Create, manage, and securely store verifiable proofs using EAS.
- Schema-Based Structuring - Define flexible schemas to standardize attestation data.
- Revocable Credentials -Enable smart contract-based revocation while ensuring transparency and trust.

TECHNOLOGIES USED

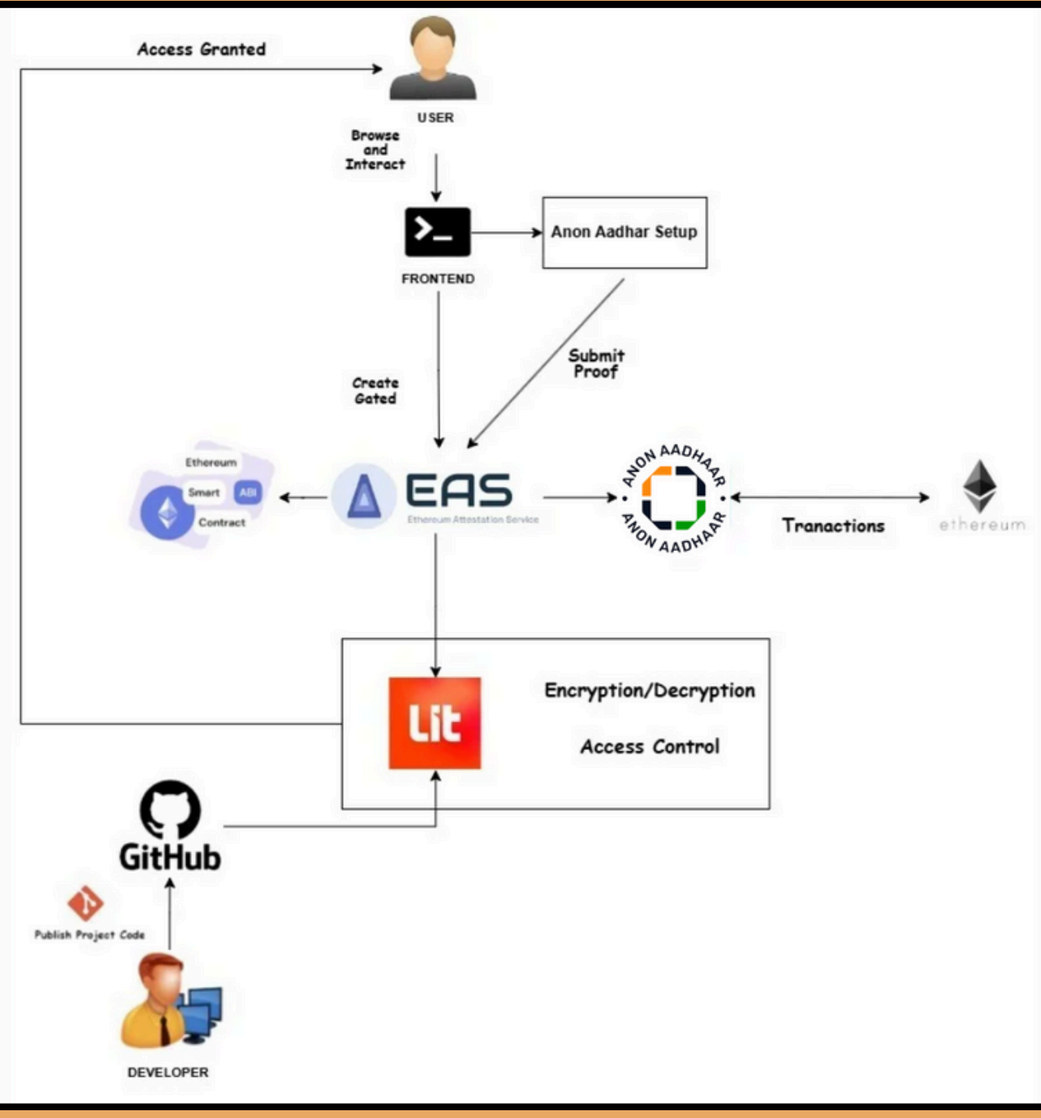
EAS Ethereum Attestation Service

node

Lit

ANON AADHAAR

ETHEREUM



METHODOLOGY

- Anon Aadhaar: Enables anonymous user verification.
- Frontend: Collects user data and triggers attestation flow..
- Ethereum EAS: Issues attestations via smart contracts.
- Lit Protocol: Controls encrypted access to gated content.
- GitHub: Developers publish access logic for integration.
